HIGH-PERFORMANCE AUDIO SHELVING SYSTEMS

In development for over fourteen years and easily upgradeable as desired, the Harmoni shelf system is a very high quality and flexible modular Hi-Fi rack. The design priority is a rack that preserves the melody and rhythm of your equipment. Harmoni racks consist of hand-built shelves in solid wood or a combination of machined aluminum and solid wood. In-between the shelves there are four solid aluminum posts connected by strong bolts and held in tension by means of spring washers. The bottom shelf is mounted on spike feet in heavy sleeves. (For fine hardwood floors we recommend protectors like the Linn Skeets.) Although the typical Harmoni rack has 4 shelves, other combinations such as 3 or 5 shelves can be supplied to suit your needs. A kit with an additional shelf and hardware can be purchased separately at any time to expand your Harmoni rack.

Oden, Tor, and Mimer

We manufacture shelves offering 3 different musical performance levels, which can be combined into a single rack system. You can choose better shelves for more sensitive devices - sources and preamps show the greatest benefit. And you may upgrade as desired. While visually it is more elegant with the same shelves everywhere, they function perfectly well when mixed together.

Mimer 3.1

Our best rack system. The surface on which your component is placed is a shelf of precision-machined aircraft aluminum. Supporting this shelf is a thin vibration-absorbing shelf made of selected solid wood.

The Mimer 3 is designed to offer the finest musical performance from your all your Hi-Fi and AV equipment. It gives very clear, flowing and nuanced sound from any component placed on it.

Tor

Tor fits between the Mimer and Oden, and is designed to bring much of the benefit of the Mimer design to a lower price. In essence it uses an Oden solid wood top shelf (instead of the machined aluminum) with the thin Mimer lower shelf.

The Tor gives some of the musical advantages of the Mimer. More musically enjoyable and even tighter rhythmically than Oden.

Oden 2.5

Although Oden is our simplest shelf it uses the same selected solid wood and solid aluminum spacers as our more expensive racks. We've tried the factory-made shelves, but they sound noticeably worse than our hand-made solid wood shelves. We dare say that compared with most hi-fi racks the reproduction becomes more harmonious and more engaging with the Oden.

Flexible system

Except for the bottom shelf you can swap any shelves with each other, and you can change one 5 shelf Harmoni rack into a pair of 3-shelf racks by just adding one new bottom shelf. Please note that although the Oden rack is shown with a single bottom shelf, all racks benefit from a double bottom shelf as shown in the Tor drawing.

Upgradability

All Harmoni rack systems are upgradable as new improvements are developed. The Harmoni rack system has been in constant development for over 14 years. The original Oden was introduced in the Spring of 1999, the Mimer in Autumn 2007 and the Tor in Winter 2009. Continuous experimentation with new materials, different dimensions, etc., have lead to the current versions of these racks. Not only is it possible to upgrade older versions of the racks to current versions but you may also upgrade one style of shelf to the next. An Oden shelf is the same as the top shelf of a Tor so only the thinner bottom shelf and spacers are needed. The Tor bottom shelf is the same as the Mimer bottom shelf so a Mimer top shelf will upgrade it to the top level of performance. Please contact us for information and pricing on any type of upgrade you are interested in.
