

# Lejonklou Slipsik 8 Moving Magnet Phono Stage

## Long live the Moving Magnet!

From Fredrik Lejonklou: “Moving Magnet cartridges are underrated and often quite badly treated. After having studied many commercial MM phono preamplifiers, I started wondering why none of them had the fancy components or the careful layout of their Moving Coil (MC) counterparts. Everything always appeared simplified and less expensive. With the Slipsik MM Phono Preamplifier I decided to change that pattern.”

The **Slipsik 8** is a standalone reference quality moving magnet (MM) phono preamplifier. An individually fine-tuned dual-mono design, the **Slipsik** circuit has evolved and improved and now features 12 separate ground planes in a star configuration. In this latest version, sensitive signals are buried inside the circuit board between narrowly spaced layers of copper. The AC cable is also screened with a copper tube, precision soldered to the chassis. All this to bring you the finest standalone Moving Magnet phono stage possible.

**Slipsik 8** is the result of a circuit board redesign with a few updated components, an improved ground connection to the chassis and new casework that is a little longer, sturdier, better-finished and better sounding.

The **Slipsik 8** is built in a very compact and sturdy black-finished aluminum enclosure with a permanent, high-quality grounded power cable.
